COMPLAINT: DROP TEST FAILED X2

CAUSE: Failed drop test x2

CORRECTION: During the PDI the LP test was conducted lock on pressure lock off pressure operating pressure. Were all correct within range drop test at the two minute. Mark would drop 1 inch on the water column to 7 x 3 minutes. It was just below seven turned everything off turned everything back on restarted the drop test the exact same thing happened again made sure everything was off double checked the water heater the furnace and the stove, both the cooktop and the oven made sure all of them were turned off, started the drop test again by the two minute mark the exact same thing happened again. Turn the propane on full pressure started at the tanks work my way from the top of the tanks through the pigtails through my test block the main LP line follow the LP line all the way through the entire frame all connections testing every single connection from front to back found no leaks went inside. Removed an access panel to gain access to the backside of the water heater tested the connection at the water heater with the soap no leaks detected, tested the backside of the furnace no leaks detected however, access to the backside of these stove would require extensive removal and un screwing to get to the actual connection which was not done.

Remove the test block, reconnected the main propane line to the tanks went back inside turned on the cooktop with the top burners turned on the oven and let them run for an extended period of time turned on the furnace to the highest temperature setting on the thermostat, let it run for an extended period of time turned on the water heater with city water hooked up and ran the water heater again for an extended period of time, one by one turned to each of the appliances back off, starting with the oven and the cooktop then the furnace then the water heater turned the water off, went back reconnected the test block to the propane system connected on the manometer retested the entire system for lock on lock off and operating pressure. They were all correct and within proper ranges conducted another drop test. There was no change at eight on the water column at three minutes. I continued to drop test to five minutes and there was no change. It held eight on the water column for a total of five minutes.

What was found is leak through on the appliances that was causing a fail. Drop test the appliances. Needed to be run for an extended period of time. Allowing the seals and seats to properly activate and works properly. REQUESTING 1.50

COMPLAINT: BLACK TANKS NOT READING

CAUSE: No water flow

Customer #: 1000
MYERS "RV" CENTER,
INC.,

1000

73629-1

Customer #: 1000
 MYERS "RV" CENTER,
 INC.,

1000

CORRECTION: During the PDI was found the middle black tank flush had no flow at all
 Located the vacuum breaker under the sink in the middle bathroom, began checking it discovered the
 waterlines were plumbed backwards
 In order to change the plumbing on the vacuum breaker to zip ties had to be cut and access panel removed
 taking out four screws
 And screwing the waterlines from the vacuum breaker, cutting the text, cramp connectors and switching the
 connectors between the two lines cramping the lines
 When removing the vacuum breaker and setting it down on the floor, all the parts inside, the vacuum
 breaker came out on the floor
 Got a new vacuum breaker attached to the waterlines for proper flow turn the water on the top of the new
 vacuum breaker blew off, spraying water all over the inside of the middle bathroom and running through the
 living area and kitchen area
 Water was turned off this new vacuum breaker was removed. Another vacuum breaker was attached.
 Water was turned on again now the black tank flush was flooded correctly out of the outlet is not working
 correctly. I did zip tie the vacuum breaker lines back in place underneath the bathroom sink secured the
 access panel.
 I had already checked the rear black tank flush the previous day, and it was flowing doing due diligence
 recheck it this date and it had no flow at all check the vacuum breaker vacuum breaker seem to be
 completely stuck not allowing any flow whatsoever. There was still no flow at all into the Vita.
 Made a adapter that would allow me to connect an airline to the line going to the bike tank, flush and
 attempt to blow out any debris that may be built up on the end or the spray end in the black tank
 Charge the line with air several times could hear airflow check the airflow outside air was flowing. Did this
 four times disconnected the air. Reconnected the waterline. Turn the water on with very little water flow
 through the black tank flush course there is going to be a difference in pressure between the water and the
 air. The water is being applied with a pressure regulator as opposed to the air not having a pressure
 regulator still no normal water flow through this black tank flush obviously theres debris in the sprayer itself
 in the black tank.
 In order to clear this, the valley board will have to be pulled down access game to the black tank flush valve
 on the side of the tank and cleaned appropriately if possible. Will call Forest River and explain the situation
 to ensure that they are aware of the amount of time that has been put into this up to this point and
 authorization for further time. already has 3.81 in it. would like an additional 2 hours to finish the work.

COMPLAINT: LEAK IN THE BATHROOM

CAUSE: Water leaking from the top from the vacuum breaker

CORRECTION: During the PDI running water through the rear bathroom toilet found that there was water on the floor at the back of the toilet could see water running down the backside of the bowl further examination found water coming out of the top of the vacuum breaker and leaking down onto the floor Recommend replacement of the vacuum breaker would request 30 minutes labor

COMPLAINT: TV NOT MOUNTED STRAIGHT

CAUSE: INSTALLED WRONG

CORRECTION: the the swing arm for the TV had twisted during transport
 The swing arm system that is attached to the wall on the TV does not appear to be sturdy enough to support the size of a TV. The TV even in the fully closed position is not stable will wobble and possibly bend the swing arms another time
 Was able to straighten the swing arm so that the TV sits square in the pocket
 Recommend replacing the full swing arm for the TV or the mounting system for the TV with something that is larger and more secure and able to withstand more of the weight of a TV of the size photographs attached of the backside
 The TV is a 65 inch
 in order to replace the TV mounting system, the TV will have to be disconnected from cable power would have to be unbolted from the back of the TV. The TV set aside in a safe place the mounting system and screw from the wall new mounting system assembled attached to the TV and attached to the wall would request one hour labor which to complete this task
